Abstracts

Protein multiplex assays are a class of advanced in vitro diagnostic tools that enable the simultaneous detection and quantification of multiple protein biomarkers or analytes within a single sample, utilizing technologies such as bead-based immunoassays (e.g., Luminex xMAP), planar arrays, or electrochemiluminescence platforms. These assays offer significant advantages over traditional single-analyte tests by reducing sample volume requirements, lowering costs per data point, increasing throughput, and providing comprehensive biomarker profiling for applications in research, clinical diagnostics, drug development, and translational medicine. By integrating multiple capture antibodies or affinity reagents on solid supports or encoded particles, they allow researchers and clinicians to analyze complex biological pathways, identify disease signatures, monitor therapeutic responses, and discover novel biomarkers with high sensitivity and specificity, making them indispensable in precision medicine and large-scale biomarker validation studies.

The global Protein Multiplex Assay market size was estimated at USD 2450.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
