Abstracts

Protein multiplex assays are analytical tools designed to simultaneously detect and quantify multiple proteins within a single biological sample, leveraging technologies such as bead-based (e.g., Luminex xMAP), planar array (e.g., sandwich or reverse-phase ELISA microarrays), and emerging platforms like proximity extension assays or aptamer-based systems. These assays enable high-throughput, cost-effective, and efficient biomarker discovery, validation, and translational research by reducing sample volume requirements, minimizing inter-assay variability, and providing comprehensive proteomic profiling for applications in drug development, clinical diagnostics, and basic research.
