Abstracts

Protein purification resins are specialized chromatographic media used in the separation and isolation of target biomolecules?such as proteins, antibodies, enzymes, or nucleic acids?from complex biological mixtures. These resins consist of porous matrices, often made from materials like agarose, cellulose, or synthetic polymers, which are functionalized with specific ligands (e.g., affinity tags, ion-exchange groups, or hydrophobic moieties) to selectively bind molecules based on properties like charge, size, hydrophobicity, or biological affinity. The selection of resin depends on factors such as binding capacity, resolution, chemical stability, scalability, and compatibility with downstream applications in research, biopharmaceutical production, diagnostics, and industrial biotechnology.

The global Protein Purification Resin market size was estimated at USD 720.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
