## Abstracts

The protein rapid transfer system is an experimental device or technology used to transfer separated proteins from gels to membranes (usually PVDF or nitrocellulose membranes). The system drives protein migration through an electric field, greatly shortening the time of traditional wet transfers while ensuring efficient capture and uniform distribution of proteins on the membrane. It is widely used in biological molecule detection and analysis such as Western Blot. Its characteristics include fast, efficient, and easy operation, and it is suitable for research that is time-sensitive or requires optimized experimental conditions.

The global Protein Rapid Transfer System market size was estimated at USD 595.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
