### Report Overview

Also known as protein demister, protein fractionator, foam fractionator. It uses the principle that the surface of the bubbles in the water can absorb various granular dirt and soluble organic matter mixed in the water. It uses oxygenation equipment or a vortex pump to generate a large number of bubbles, and the seawater will be purified through a protein separator. All these bubbles Concentrate on the surface of the water to form foam, and collect the foam that has absorbed the dirt in the container on the water surface, and it will turn into a cloudy liquid and be discharged.
