Abstracts

The protein wet transfer system is a device used to transfer proteins from gels to membranes (such as nitrocellulose or polyvinylidene fluoride membranes) and is widely used in Western Blot experiments. This system promotes the movement of proteins from the gel to the membrane by creating an electric field in a tank filled with transfer buffer. It is generally suitable for transferring larger molecular weight proteins because it keeps the gel moist and reduces protein diffusion losses. Wet transfer is known for its high transfer efficiency and stability, and is suitable for protein quantification and high-sensitivity detection needs.

The global Protein Wet Blotting System market size was estimated at USD 337.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
