Abstracts

Protic Ionic Liquids (PILs) are a type of ionic liquid formed through the transfer of a proton from a Brønsted acid to a Brønsted base, resulting in a protonated cation and a corresponding anion. Unlike aprotic ionic liquids, PILs contain a labile proton, enabling strong hydrogen bonding and influencing properties such as viscosity, conductivity, and solvation. They are typically liquid at or near room temperature, have low volatility, and can be tailored for specific applications by varying the acid-base pair. PILs are used in areas such as green solvents, electrolytes for energy storage devices, and media for biochemical reactions.

The global Protic Ionic Liquids (PILs) market size was estimated at USD 64.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
