Abstracts

Proton beam therapy devices are highly specialized medical equipment that utilize a particle accelerator to generate a beam of protons, which is precisely directed at cancerous tumors with sub-millimeter accuracy, offering a significant dosimetric advantage over conventional photon-based radiotherapy by depositing the majority of their energy at a specific depth (the Bragg peak) while minimizing radiation exposure to surrounding healthy tissues and critical organs. This technology is primarily indicated for treating solid tumors in anatomically complex or radiation-sensitive areas, such as pediatric cancers, ocular melanomas, base-of-skull tumors, and certain prostate and central nervous system malignancies, where precision is critical to reducing both short-term side effects and long-term complications.

The global Proton Beam Therapy Devices market size was estimated at USD 1257.89 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
