Report Overview

Proton Exchange Membrane Fuel Cell (PEMFC) is an advanced electrochemical energy conversion device that generates electricity through the reaction of hydrogen and oxygen, producing water and heat as byproducts. It consists of a proton-conducting polymer membrane sandwiched between an anode and a cathode, where hydrogen molecules are split into protons and electrons at the anode, with protons passing through the membrane while electrons travel through an external circuit, creating an electric current. PEMFCs are highly efficient, operate at relatively low temperatures (60-80°C), and offer rapid startup times, making them ideal for automotive, stationary power, and portable applications. Their modular design allows scalability, while zero-emission operation aligns with global decarbonization goals. However, challenges remain, including high costs related to platinum catalysts, membrane durability, and hydrogen storage and distribution infrastructure.

The global Proton Exchange Membrane Fuel Cell (PEMFC) market size was estimated at USD 2464.58 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 31.30% during the forecast period.
