Abstracts

Proximal humerus implants are orthopedic devices designed to replace or reconstruct the proximal (upper) portion of the humerus bone in the shoulder joint, typically used in cases of severe fractures, osteoarthritis, avascular necrosis, or failed previous surgeries. These implants come in various types, including hemiarthroplasty (replacing only the humeral head), total shoulder arthroplasty (replacing both the humeral head and glenoid socket), and reverse total shoulder arthroplasty (which reverses the ball-and-socket mechanics to improve function in patients with rotator cuff deficiencies). The design and material selection often involving cobalt-chrome, titanium, or polyethylene components aim to restore mobility, reduce pain, and provide biomechanical stability, with considerations for anatomical fit, fixation methods (cemented or cementless), and compatibility with patient-specific factors such as bone quality and soft tissue integrity.

The global Proximal Humeral Implants market size was estimated at USD 315.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
