## Abstracts

Pseudovirus products are based on replication-defective viral particles, with their genes usually altered or modified to possess virus-mimicking physical structures and specific nucleic acid sequences. These virus-like particles are similar in analytical characteristics to real viruses but lack the ability to self-replicate and infect. Pseudovirus products, due to their biosafety, are widely used as measurement standards and play an important role in the verification and evaluation of viral nucleic acid qualitative and quantitative measurement methods, as well as in laboratory quality control. They can participate in the entire process of virus detection from extraction to amplification, providing powerful tools for virology research, vaccine development, and drug screening.

The global Pseudovirus Products market size was estimated at USD 410.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
