Abstracts

Pt-based alloy catalysts refer to heterogeneous catalysts where platinum is alloyed with one or more other metals, such as ruthenium, cobalt, nickel, palladium, or iridium, to form bimetallic or multimetallic nanoparticles dispersed on a support material, typically carbon; these alloys are engineered to enhance catalytic performance by modifying electronic and geometric properties?such as d-band center shift and strain effects?which can improve activity, selectivity, and stability compared to pure platinum catalysts, particularly in key applications like proton-exchange membrane fuel cells (where they catalyze the oxygen reduction reaction), automotive exhaust systems (as three-way catalysts for emissions control), and various industrial chemical processes including hydrogenation, dehydrogenation, and petroleum refining.

The global Pt Based Alloy Catalyst market size was estimated at USD 1200.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
