Report Overview

Pt based alloy catalysts are catalysts with platinum (Pt) as the main component and form alloy structures with other metal or non-metallic elements. Alloyed platinum catalysts can change their catalytic performance, improve their activity, stability, and selectivity by alloying with other elements to meet the needs of specific catalytic reactions. The alloy elements of Pt based alloy catalysts can be transition metals, rare earth metals, precious metals, non precious metals, or carbon. The introduction of these alloy elements can regulate the electronic structure, lattice structure, and surface characteristics of the catalyst, thereby affecting its catalytic activity and selectivity. Pt based alloy catalysts play a key role in many important catalytic reactions, including the oxygen reduction reaction catalyst in Proton-exchange membrane fuel cell (PEMFC): Pt based alloy catalysts are widely used in the cathode catalyst layer of Proton-exchange membrane fuel cell to promote the oxygen reduction reaction and improve the efficiency of fuel cells. Hydrogen catalyst for electrolysis of aquatic products: Pt based alloy catalyst can provide Active site on the catalyst surface during Electrolysed water, promote Chemical decomposition of water, and generate hydrogen. Catalysts in organic synthesis reactions: Pt based alloy catalysts have high activity and selectivity in organic synthesis reactions, such as hydrogenation reactions, oxidation reactions, hydrogenolysis reactions, etc. Electrochemical catalysts: Pt based alloy catalysts are widely used in the field of electrochemical catalysis, including electrolytic hydrogen production, battery electrode catalysts, etc. The research and development of Pt based alloy catalysts are of great significance for improving energy conversion efficiency, reducing catalyst costs, and improving environmental sustainability.
