Abstracts

PTC resettable devices, also known as positive temperature coefficient thermistors or polymeric PTCs, are passive electronic components that serve as self-resetting overcurrent protection devices by exhibiting a sharp increase in electrical resistance when their temperature rises beyond a specific threshold due to excessive current flow, thereby limiting the current; once the fault is removed and the device cools down, it automatically returns to its low-resistance state, making it reusable and eliminating the need for replacement unlike traditional fuses.

The global Ptc Resettable Devices market size was estimated at USD 1222.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
