Abstracts

Polytetrafluoroethylene (PTFE), commonly known as the "plastic king", is a polymer made by polymerizing tetrafluoroethylene as a monomer. Its chemical formula is $(C_2F_4)_n$, and it has excellent heat and cold resistance. It can be used for a long time at $-180\sim 260\text{ }^\circ\text{C}$. This material has the characteristics of acid and alkali resistance, resistance to various organic solvents, and is almost insoluble in all solvents. At the same time, polytetrafluoroethylene has the characteristic of high temperature resistance, and its friction coefficient is extremely low. Therefore, in addition to its lubricating effect, it has also become an ideal coating for easy cleaning of the inner layer of water pipes. PTFE is an excellent fluorinated polymer that can be used as an ideal lining material for conduits. Its significantly low friction coefficient enhances the performance of the conveying system. This feature facilitates the smooth delivery of medical devices such as stents or balloons. PTFE is known for its durability and excellent tensile strength, ensuring the strength and elasticity of the catheter liner, and effectively preventing damage or tearing even under harsh medical device usage conditions.

The global PTFE Etching Tube market size was estimated at USD 592.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
