Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PTFE Packing competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PTFE Packing is a sealing material woven from polytetrafluoroethylene fibers as the main raw material. It has excellent chemical stability and can withstand corrosion from various strong acids, strong bases, and organic solvents; Low friction coefficient, good self-lubricating performance, can reduce wear on sealing parts; Simultaneously possessing excellent resistance to high and low temperatures, it can maintain stable physical and chemical properties over a wide temperature range. PTFE Packing has broad prospects and fierce competition. From the perspective of advantages, its excellent chemical stability, low friction coefficient, and resistance to high and low temperatures have led to a continuous increase in demand for sealing in industries such as chemical, petroleum, and pharmaceutical. With the steady development of these industries, the market's demand for it is expected to further increase. However, the competition in this market is also quite fierce, with many companies participating and product price wars occurring. At the same time, some high-performance imported products still occupy a certain high-end market share. Domestic enterprises need to continue to make efforts in improving product quality, reducing costs, and expanding high-end application fields to enhance their competitiveness in the market.

The global PTFE Packing market size was estimated at USD 693.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
