### Report Overview:

PTFE membrane filter material is made by a special process and different filter material base cloth——add a layer of polytetrafluoroethylene (PTFE) film on the surface of ordinary filter material, giving the filter over 3-year service span. This film acts as a "primary dust layer", and the material exchange is performed on the surface of the film, which can be effectively filtered at the beginning of use. The unique three-dimensional network structure of the film prevents dust from passing through, and there is no need to worry about clogging of the pores. This filtering method is called "surface filtering".

The Global PTFE (Polytetrafluoroethylene) Membrane Filter Market Size was estimated at USD 693.89 million in 2023 and is projected to reach USD 995.49 million by 2029, exhibiting a CAGR of 6.20% during the forecast period.
