Report Overview:

Polytetrafluoroethylene (PTFE) is a polymer of tetrafluoroethylene (TFE), which is an important organic fluorine material with excellent dielectric properties and extremely low friction coefficient. It is commonly used as engineering plastics and can be made into polytetrafluoroethylene pipes, rods, strips, plates, films, etc. It is widely used in industry, daily life, and is known as the "plastic king". PTFE is prepared by free radical polymerization of TFE. Its polymerization methods include bulk polymerization, solution polymerization, suspension polymerization, lotion polymerization (dispersion polymerization). Suspension polymerization and dispersion polymerization are mainly used in industry. Tetrafluoroethylene (TFE) is an organic compound. It is a colorless gas at normal temperature and pressure and insoluble in water. It is mainly used as raw material for manufacturing new heat-resistant plastics, engineering plastics, new fire extinguishing agents and fog suppressants. At present, the production capacity and output of China's polytetrafluoroethylene (PTFE) industry are in a rapid expansion stage. However, due to the high-end transformation and upgrading of PTFE in some developed countries, low-end production capacity has shifted to China, which has led to the phenomenon of low-end overcapacity in the domestic PTFE industry.

The Global PTFE Resin Market Size was estimated at USD 1240.76 million in 2023 and is projected to reach USD 1653.26 million by 2029, exhibiting a CAGR of 4.90% during the forecast period.
