## Abstracts

A public transportation mobile WiFi system is a wireless network coverage and management system designed specifically for public transportation vehicles, which aims to provide passengers with convenient and stable Internet access services. The public transportation mobile WiFi system converts the 4G or 5G network signal received by the vehicle - mounted router into a WiFi signal and broadcasts it within the vehicle cabin. When passengers search for and connect to the corresponding WiFi signal in the vehicle, they will first see the advertisement information, and then jump to the login or registration page. New users need to register through their mobile phone numbers and verify through text messages before they can log in, while old users only need to enter their mobile phone numbers and passwords to access the Internet.

The global Public Transportation Mobile WiFi System market size was estimated at USD 5869.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
