Abstracts

Pull cord encoders are sensors used to measure linear displacement and are widely used in industrial automation, robotics, medical devices, and test systems. They convert physical displacement into electrical output signals to accurately monitor the position or movement of an object. The core components of pull cord encoders include a thin steel wire (pull cord) wound on a spring-loaded shaft and a built-in encoder. When an external force pulls the pull cord, the steel wire drives the shaft to rotate, and the encoder calculates the corresponding linear displacement based on the rotation angle of the shaft.

The global Pull Cord Encoders market size was estimated at USD 3145.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
