Abstracts

Pulmonary edema treatment encompasses a range of medical interventions aimed at addressing the accumulation of fluid in the lungs, a condition that can arise from cardiac causes (such as heart failure or myocardial infarction) or non-cardiac factors (including acute respiratory distress syndrome, high-altitude exposure, or certain medications). The treatment approach is multifaceted, typically involving oxygen therapy to improve hypoxia, diuretics like furosemide to reduce fluid overload, vasodilators such as nitroglycerin to decrease preload and afterload on the heart, and inotropic agents like dobutamine to enhance cardiac contractility in cases of cardiogenic pulmonary edema. For severe or refractory cases, non-invasive or invasive mechanical ventilation may be necessary to support respiratory function, while underlying causes such as managing hypertension, treating infections, or addressing renal dysfunction are concurrently targeted to prevent recurrence and improve patient outcomes.

The global Pulmonary Edema Treatment market size was estimated at USD 2045.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
