Report Overview

Certain washing machines come with a disc-shaped pulsator at the bottom of the drum to wash clothes. Pulsator wash is used in top load washing machines where the wash drum is positioned vertically and rotates on a vertical axis back and forth continuously to loosen the dirt from clothes. The pulsator is a propeller that rotates back and forth to create water current. This turbulent water current moves the clothes from outer portion of the drum to inner to the center creating friction between clothes and water resulting in gentle and efficient wash. This is aided with the help of cones, discs, fins and wheels on the body of pulsator/impeller. All of these rotate together to create current in the water.

The global Pulsator Washing Machine market size was estimated at USD 28000 million in 2023 and is projected to reach USD 43066.29 million by 2032, exhibiting a CAGR of 4.90% during the forecast period.
