Abstracts

Pulse electrocoagulation is a medical device that generates high-frequency current pulses, acts on human tissue, and uses the thermal effect generated when the current passes through the tissue to denature and coagulate tissue proteins, thereby achieving the purpose of hemostasis and tissue cutting. Pulse electrocoagulation is widely used in the medical field, especially in surgical operations. The working principle of pulse electrocoagulation is based on the thermal effect of high-frequency current. When high-frequency current passes through human tissue, the current flowing in the tissue will generate heat, causing the tissue temperature to rise. When the tissue temperature reaches a certain level, the protein in the tissue will denature and coagulate, thereby achieving the effect of hemostasis and tissue cutting. By controlling the parameters such as the frequency, intensity and time of the current, the pulse electrocoagulation can accurately control the range and degree of the thermal effect, thereby achieving precise treatment of the tissue.

The global Pulse Electrocoagulation Device market size was estimated at USD 591.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
