Report Overview

Pulse mode-locked fiber laser is a laser based on fiber technology that can produce high-quality, stable pulse laser beams. Unlike continuous wave fiber lasers, pulse mode-locked fiber lasers have obvious pulse characteristics in the laser output. The working principle of pulse mode-locked fiber laser is to achieve pulse laser output by introducing a modulation mechanism into the fiber laser cavity. Common modulation mechanisms include modulation pumping, modulation loss, and modulation phase. These modulation mechanisms enable the mode in the fiber laser cavity to be locked on a specific pulse mode, thereby producing stable pulse laser output.

The global Pulse Mode Locked Fiber Laser market size was estimated at USD 612.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
