## Abstracts

Pulsed Eddy Current Inspection (PEC) is a non-destructive testing method used to detect corrosion, wall loss, and other defects in conductive materials?particularly carbon steel?without removing coatings or insulation. It works by sending a short-duration, pulsed magnetic field into the material using a probe; when the pulse stops, the changing magnetic field induces transient eddy currents in the metal. The decay rate of these eddy currents, measured by the same probe, depends on the material?s thickness and condition, allowing inspectors to assess structural integrity even through paint, fireproofing, or insulation. PEC is widely used in oil, gas, petrochemical, and power industries for rapid, in-situ screening of pipelines, vessels, and structural steel where direct access is difficult.

The global Pulsed Eddy Current Inspection market size was estimated at USD 78.35 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
