Abstracts

Pulsed TIG welding machine is a welding method that uses argon gas as a protective gas. Through the action of pulse current, a molten pool is generated in the arc action zone. When the arc current is maintained, the molten pool solidifies and forms a welding slope. When the next pulse current is applied, a second welding pool is generated on the area of the solidified welding slope and the base metal. When the arc current is applied, it solidifies into a second welding wave and overlaps with the first welding wave. This cycle repeats itself, forming a weld seam composed of many overlapping welding waves.

The global Pulsed TIG Welding Machine market size was estimated at USD 548.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
