Abstracts

Pultruded carbon plates for wind turbine blades are a type of composite material plate that is formed through the pultrusion process and is specifically designed for use in wind turbine blades. The main reinforcing material is carbon fiber. Pultrusion is a manufacturing technique for composite materials. In this process, continuous fiber reinforcements, usually carbon fibers in the case of pultruded carbon plates, are pulled through a resin bath. The resin, such as epoxy resin, impregnates the fibers thoroughly. Then, the resin-impregnated fibers are drawn through a heated die with a specific cross-sectional shape.

The global Pultruded Carbon Plates for Wind Turbine Blades market size was estimated at USD 3622.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
