Abstracts

PVC external lubricants are chemical additives incorporated into polyvinyl chloride (PVC) formulations to reduce friction and adhesion between the molten polymer and processing equipment surfaces during high-temperature manufacturing processes such as extrusion, calendering, or injection molding. These lubricants function by migrating to the surface of the polymer melt, forming a thin boundary layer that minimizes shear stress, prevents material degradation, improves surface finish, and enhances processing efficiency by reducing torque and energy consumption. Typically derived from substances like metal stearates, oxidized polyethylene wax, or ester-based compounds, their selection and concentration are carefully balanced with internal lubricants and other additives to achieve optimal processing characteristics and final product properties without negatively affecting fusion time, clarity, or mechanical strength.

The global Pvc External Lubricant market size was estimated at USD 350.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
