Abstracts

PVC polymerization initiators are chemical compounds, most commonly organic peroxides or azo compounds, which decompose to generate free radicals that initiate the chain reaction of vinyl chloride monomer (VCM) polymerization, forming polyvinyl chloride (PVC). These initiators are critical in determining the rate, efficiency, and molecular characteristics of the resulting PVC resin, influencing properties such as thermal stability, molecular weight distribution, and processability. The selection of an appropriate initiator depends on factors like polymerization method (suspension, emulsion, or bulk), desired reaction temperature, and the specific end-use application of the PVC, whether rigid or flexible.

The global Pvc Polymerization Initiator market size was estimated at USD 720.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
