Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PVC Solid Wall Pipe competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The main component of PVC solid wall pipes is polyvinyl chloride. In order to improve its flexibility and processability, plasticizers are generally added during the production process. PVC solid wall pipes are not resistant to high temperatures and will decompose and release hydrogen chloride in high temperature environments, resulting in discoloration and decreased physical and mechanical properties of the pipes. PVC solid wall pipes are often used in drainage pipes and other applications due to their insufficient hardness and easy aging. In the field of construction, PVC solid wall pipes are used for water supply and drainage systems, especially for indoor drainage pipes and protective pipes for wires and cables. Its excellent corrosion resistance enables it to be used for a long time in humid or chemically corrosive environments. In agriculture, PVC solid wall pipes can be used in irrigation systems to effectively transport water and liquid fertilizers, providing reliable means of water transportation and fertilization for agriculture. PVC solid wall pipes are also used in the industrial field to discharge wastewater and chemical liquids, especially in the treatment of acidic and alkaline fluids. Due to the environmental friendliness and durability of its materials, PVC solid wall pipes are also suitable for some urban infrastructure projects, such as drainage systems and underground cable protection. In 2024, global PVC Solid Wall Pipe production reached approximately 5536 K MT, with an average global market price of around US\$ 1180 per MT. The production capacity of a single small-diameter production line is around 2000 tons; The production capacity of a single medium caliber production line is around 4000 tons; The production capacity of a single large-diameter production line is about 5000 tons. The gross profit margin is around 20%. PVC solid wall pipe is a pipe

made mainly from PVC resin with fillers and additives added. The downstream industries of PVC pipes mainly include municipal, construction, agriculture, communication, power, industrial and other industries. The product is widely used in municipal and building water supply and drainage, agriculture (drinking water and irrigation), municipal sewage, communication power sheath, gas transmission, radiant heating, industrial fluid transportation and other fields. With the development of the global economy and the support of national industrial policies, the production and consumption of end products are showing a stable growth trend. The implementation of major projects such as shantytown renovation, urban underground pipeline construction, and water pollution prevention and control plans has created development opportunities for the plastic pipeline industry.

The global PVC Solid Wall Pipe market size was estimated at USD 6532.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
