Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on PVD Coating Targets competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. PVD coating targets refer to the source materials used to provide coating materials in the physical vapor deposition (PVD) process. These targets are usually made of high-purity metals, alloys or ceramics. The target atoms or molecules are detached from the surface by evaporation, sputtering or other physical methods, and deposited on the surface of the substrate in a vacuum environment to form a uniform film with specific functions (such as wear resistance, corrosion resistance, decorative or conductive). PVD coating targets are widely used in aerospace, automotive, electronics, cutting tools and medical devices to improve product performance and extend service life. The choice of target directly affects the quality and characteristics of the coating, so its purity, density and composition control are crucial.

The global PVD Coating Targets market size was estimated at USD 79.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
