Abstracts

PVD sputtering targets are specialized materials, typically in the form of discs or plates, used in physical vapor deposition (PVD) processes to deposit thin films onto substrates through sputtering, a technique where atoms are ejected from the target surface by ion bombardment and then deposited layer by layer to form coatings with specific properties such as electrical conductivity, optical reflectivity, hardness, or corrosion resistance; these targets are fabricated from high-purity metals, alloys, ceramics, or compounds and must meet stringent requirements for composition, density, microstructure, and surface finish to ensure consistent film quality, performance, and yield in applications spanning semiconductors, display technologies, solar cells, decorative coatings, and cutting tools.
