## Abstracts

Pyroelectric infrared gas detectors operate on the principle of the pyroelectric effect. The detector contains a piece of ferroelectric crystal material with electrodes on either side, essentially a capacitor. When incident infrared radiation (such as infrared light emitted by gas molecules after absorbing energy) is absorbed by one of the detector's electrodes (usually a black coating or processed absorbent metal surface), it causes the crystal to heat up. This heating generates a pyroelectric voltage, which can be detected electronically, or as a current, when the voltage is held constant. Due to the pyroelectric effect, the detector does not respond directly to the radiation, but only to the heat generated.

The global Pyroelectric Infrared Gas Detectors market size was estimated at USD 862.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
