## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Pyrolusite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Pyrolusite is the most common naturally occurring form of manganese dioxide (MnO<sub>2</sub>), typically appearing as a black to steel-gray mineral with a metallic luster, and it is the primary ore of manganese. It forms in sedimentary deposits, hydrothermal veins, and weathered manganese-rich rock environments. In the supply chain, pyrolusite is mined from large deposits in countries such as South Africa, Gabon, Australia, China, Brazil, and Ukraine, and then processed for various uses. After extraction, it is refined to produce electrolytic manganese dioxide (EMD) and chemical manganese dioxide (CMD), which are essential in the production of alkaline batteries, lithium-ion batteries, and other energy storage devices. Additionally, pyrolusite is used in steelmaking as a deoxidizer and desulfurizer, in glassmaking as a colorant and decolorizer, and in chemical industries for producing potassium permanganate and other oxidizing agents, making it a critical raw material in global metallurgy, chemical, and energy supply chains. The pyrolusite industry sustains an annual production volume of around 5.6 million tons, supported by a global production capacity of approximately 7.1 million tons per year, ensuring supply flexibility across metallurgical, chemical, and energy storage applications. With an average market price of about USD 330 per ton, producers maintain a gross margin near 22%.

The global Pyrolusite market size was estimated at USD 1849.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
