Abstracts

Pyrolytic Graphite is a unique form of graphite manufactured by the decomposition of a hydrocarbon gas at a very high temperature in a vacuum furnace. It is nucleated on the substrate and grown with texture along the C axis. The result is an ultra-pure product that is near theoretical density and extremely anisotropic. The material is grown onto a substrate giving it a layered composition. This also means it has different properties in different planes. In the C plane (across its layers) it has low thermal conductivity, acting as an insulator. In the A-B plane (with the layers) it has very high thermal conductivity, acting as a superb conductor.

The global Pyrolytic Graphite Substrate market size was estimated at USD 270.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
