Abstracts

Q-switched DPSS (Diode-Pumped Solid-State) lasers are a category of high-performance lasers that combine diode pumping with solid-state gain media, such as Nd:YAG or Nd:YVO₄, and integrate Q-switching technology to generate short, high-energy pulses. These lasers operate by using an optical switch—typically an acousto-optic or electro-optic modulator—to temporarily prevent lasing action, allowing energy to build up within the cavity before being released in a nanosecond-scale pulse with peak powers significantly higher than those achievable with continuous-wave or long-pulse lasers. This combination results in highly efficient, compact, and reliable systems capable of delivering precise, high-intensity bursts of laser light, making them particularly well-suited for applications requiring material processing, medical treatments, scientific research, and LIDAR systems where controlled ablation, marking, or nonlinear frequency conversion is essential.

The global Q Switched Dpss Lasers market size was estimated at USD 780.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
