Abstracts

Q Switched Ruby Lasers are solid-state lasers that utilize a synthetic ruby crystal (chromium-doped aluminum oxide) as the gain medium and incorporate a Q-switching mechanism to produce high-intensity, nanosecond-duration pulses of red light at a wavelength of 694.3 nm. These lasers are characterized by their ability to generate extremely high peak powers in short bursts, making them particularly effective for applications requiring precise ablation or interaction with specific materials, such as tattoo removal, pigmented lesion treatment, and certain types of industrial material processing where the 694 nm wavelength is optimally absorbed. While historically significant as one of the earliest developed laser types, their current market presence is niche, having been largely supplanted in many medical and industrial applications by more efficient and versatile lasers like Nd:YAG, Alexandrite, or diode systems, though they retain relevance in specialized dermatological and research contexts due to their unique spectral properties.

The global Q Switched Ruby Lasers market size was estimated at USD 30.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
