Abstracts

A quadrature demodulator is an electronic device used to extract the baseband signal from a modulated carrier wave, particularly in systems employing quadrature amplitude modulation (QAM) or phase-shift keying (PSK). It operates by mixing the incoming signal with two local oscillator signals that are 90 degrees out of phase with each other, producing in-phase (I) and quadrature (Q) components that together represent the original modulating signal. This process enables the recovery of both amplitude and phase information, making it essential in applications such as digital communications, software-defined radios, radar systems, and television broadcasting, where complex modulation schemes are utilized for efficient data transmission.

The global Quadrature Demodulator market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
