Report Overview

QSAR is a computational modeling method used to determine relationships between structural properties and biological activities of chemical compounds. The drug discovery and development, along with studying the potential therapeutic applications of the drug, is a complicated, expensive, and time-consuming process. Pharmaceutical and biopharmaceutical companies are adopting various computational methodologies such as QSAR to increase the efficiency of this entire process. In stages from hit identification to lead optimization, techniques such as ligand or structure-based virtual screening are widely being used by various pharmaceutical companies. With the help of modeling, existing data can be leveraged to gain insights into product safety and effectiveness. Owing to the efficiency of computational methods, the Food and Drug Administration (FDA) and European Medicines Agency (EMA) have incorporated drug modeling to achieve efficient drug development. In addition, in silico (computer-aided) designs are being utilized to expedite and accomplish the process of hit identification; optimize the distribution, absorption, and metabolism of compounds; and draw toxicity profile to avoid safety issues.
