Abstracts

Quantum Dots Microspheres (QDMS) are a type of nanoscale fluorescent material composed of numerous quantum dots aggregated together, formed into microsphere shapes through specific nanotechnology, with a particle size ranging approximately between 100 to 400 nanometers. These microspheres not only retain the superior optical properties of the individual quantum dots, such as significant Stokes shift, strong resistance to photobleaching, narrow and symmetrical emission spectrum, and high overlap in the excitation spectrum, but also achieve multicolor luminescence and higher fluorescence intensity through the microsphere structure. These characteristics make Quantum Dots Microspheres (QDMS) exhibit higher sensitivity, lower background noise, better stability, and higher detection efficiency in application fields such as biological labeling, medical diagnostics, and optical sensors compared to traditional fluorescent materials.

The global Quantum Dots Microspheres (QDMS) market size was estimated at USD 162.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.80% during the forecast period.
