Abstracts

Quantum Key Distribution (QKD) uses physics instead of mathematics to encode messages, which provides greater security. The genesis of QKD (Quantum Key Distribution) traces back to the late 1960s, when Stephen Wiesner first proposed the idea of encoding information on photons to securely transfer messages. In 1984, the physicist Charles Bennett and cryptographer Gilles Brassard worked together to mature this idea by introducing the first QKD protocol, known as 'BB84'. Five years later, they built the first QKD prototype system which was said to be 'secure against any eavesdropper who happened to be deaf' as it made audible noises while encoding crypto key onto single photons. From its relatively humble beginnings, QKD has gained global interest as a unique cybersecurity solution with active research groups across North America, Europe, Australia, and Asia.

The global Quantum Key Distribution Qkd Device market size was estimated at USD 1509.68 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 34.90% during the forecast period.
