Abstracts

Quantum Processing Units (QPUs) are specialized hardware systems designed to perform quantum computations by leveraging the principles of quantum mechanics, such as superposition and entanglement, to process information in fundamentally different ways than classical processors. Unlike traditional CPUs and GPUs, which rely on binary bits (0s and 1s), QPUs use quantum bits or qubits, which can exist in multiple states simultaneously, enabling them to solve certain complex problems like optimization, cryptography, molecular simulation, and large-scale data analysis exponentially faster. These systems typically operate at cryogenic temperatures to maintain quantum coherence and are often integrated with classical computing infrastructure for hybrid computational tasks.

The global Quantum Processing Units market size was estimated at USD 1050.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 32.50% during the forecast period.
