Report Overview

The name of quantum well infrared detector comes from the fact that its constituent materials form electron or hole potential wells on the energy band structure. The electron or hole transitions caused by external photons belong to the inter subband transition. The streamers are collected to form photocurrent under the action of external electric field. There are two types of materials with wide band gap (GaAs = 1.43eV), namely photoconductive quantum well materials (GaAs / AlGaAs) and photovoltaic quantum well materials (InAs / InGaSb, InAs / InAsSb)
