Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Quartz Fiber Electronic Cloth competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of quartz fiber electronic cloth will reach 20.16 million meters, with an average selling price of US\$35.71 per meter. The upstream of electronic-grade glass fiber cloth is mainly mineral raw materials such as pyrophyllite, while the upstream of quartz fiber cloth is mainly quartz sand, and the upstream is high-purity quartz ore. The downstream application process of the two is the same. They are woven into cloth and then made into copper-clad laminates, which are then used for printed circuit boards and finally applied to the terminal industry. The core difference lies in the upstream raw material link. The key technical parameters of electronic cloth are mainly dielectric constant and dielectric loss. The dielectric constant characterizes the ability of dielectric materials to store charge in an electric field. The lower its value, the faster the signal transmission speed and the smaller the delay, which is suitable for high-speed signal transmission. Dielectric loss reflects the ability of dielectric materials to convert electrical energy into thermal energy. The smaller its value, the smaller the signal transmission loss. Copper-clad laminates are composed of electronic cloth, resin matrix and copper foil. Their dielectric properties are determined by the weighted average of the dielectric constant and dielectric loss of the electronic cloth and resin by volume. Currently, chip manufacturers have carried out research on 224G high-speed interconnect technology. The 224G motherboard is mainly based on high-speed PCB, which has extremely high requirements for the dielectric loss of PCB materials. Data centers are one of the main application areas of 224G, involving servers, network routers, storage and other equipment, which require a large number of high-speed PCBs. In terms of performance comparison, under 10 GHz conditions, the

dielectric constant of quartz fiber can be reduced to below 4, and the dielectric loss limit is 2/10000, while the dielectric loss threshold of traditional glass fiber is 1/1000. In the copper clad laminate grade standard (such as Panasonic's M5M9), the M9 standard requires a dielectric loss of less than 9/10000, and it is necessary to break through the bottleneck of 1/1000. Traditional glass fiber is limited, and the quartz fiber solution has become a clear direction.

The global Quartz Fiber Electronic Cloth market size was estimated at USD 720.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 23.30% during the forecast period.
