## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Quartz Ring for Etching Process competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Quartz rings for etching processes are key process components used in semiconductor manufacturing, microelectronics processing, and optical device fabrication. Made of high-purity quartz, they are primarily used in various etching equipment and reaction chambers to ensure process stability and precision. In 2024, global production of quartz rings for etching processes reached 429,400 units, with an average selling price of \$513.32 per unit. Quartz rings are mainly used in semiconductor silicon wafer etching and other processes. They have very high requirements for dimensional accuracy, cleanliness, appearance, etc. Some products are not allowed to be repaired and must be formed in one go. All have high requirements for processing capabilities. Etching is the process of removing unnecessary materials attached to the surface of the wafer by chemical or physical methods. Quartz products used in etching processes mainly include quartz rings and quartz protective covers. As the process technology is reduced, the number of etching processes in the wafer processing process gradually increases. According to SEMI statistics, the 65nm process requires about 20 etchings, and the 5nm process requires up to 160 etchings. As the number of etchings increases, the consumption of quartz products such as quartz rings will increase, driving the growth of demand for high-purity quartz materials.

The global Quartz Ring for Etching Process market size was estimated at USD 220.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
