Report Overview

Quartz sand fracturing proppant is a quartz sand product with high fracturing strength. It is mainly used for underground support in oil fields to increase the production of oil and natural gas. It is an environmentally friendly product. This product uses natural quartz as raw material. It is a substitute for medium and low-strength proppant such as ceramsite, glass balls, and metal balls. It has a good effect on increasing oil and natural gas production. During deep well mining of oil and gas, high closing pressure and low permeability mineral deposits undergo fracturing treatment to crack the oil and gas-bearing rock formations, and the oil and gas flow out from the channels formed by the cracks. Quartz sand support material is used along with high-pressure solution to enter the stratum and fill the rock formation fissures to support the cracks from closing due to stress release, thereby maintaining high conductivity, allowing oil and gas to flow smoothly, and increasing production.
