Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Quasi-Resonant Flyback Control IC competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The quasi-resonant flyback control chip is a high-performance integrated circuit controller for switching power supplies, designed specifically for flyback converter topologies. It uses quasi-resonant (QR) technology to make the power switch tube (such as MOSFET) operate at the resonant valley voltage point formed by the transformer's excitation inductance and parasitic capacitance when it is turned on, thereby achieving "zero voltage switching" (ZVS), thereby significantly reducing switching losses and electromagnetic interference (EMI), and improving system efficiency (often reaching more than 93%). Its core technologies include multi-mode load adaptive control (such as full-load quasi-resonance, light-load frequency foldback, and no-load burst mode), with high-voltage startup, frequency jitter noise reduction, line voltage feedforward compensation and other functions, and integrated overvoltage, overcurrent, overheating and other protection mechanisms. Such chips are widely used in high-efficiency scenarios such as adapters, chargers, LED drivers and server power supplies.

The global Quasi-Resonant Flyback Control IC market size was estimated at USD 1216.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
