Report Overview

QUV UV aging test chamber is a test equipment that simulates ultraviolet radiation, temperature, and humidity conditions in outdoor natural environments to evaluate the weathering performance of materials. It can quickly and realistically reproduce the damage to materials caused by sunlight, rain, and dew, providing a scientific basis for product design, improvement, and research and development of new materials. By simulating ultraviolet radiation and humidity changes in the natural environment, it is possible to obtain weathering performance data of materials in a short time and accelerate the aging process. In addition, the accuracy and reliability of the test results are ensured by precisely controlling the temperature, humidity and UV radiation intensity in the test chamber. Test parameters such as UV radiation intensity, temperature, humidity and test time can also be adjusted according to the test requirements of different materials.
