Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on r-DMT competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Recycled Dimethyl Terephthalate (r-DMT) is a purified monomer obtained through the chemical depolymerization of post-consumer and post-industrial polyethylene terephthalate (PET) waste. It is generated mainly via methanolysis, where PET is broken down into dimethyl terephthalate and ethylene glycol, followed by purification processes that yield a recycled grade equivalent to virgin DMT. r-DMT serves as a fundamental building block for the re-polymerization of PET, polybutylene terephthalate (PBT), cyclohexanedimethanol terephthalate (CHDM), and various specialty copolyesters. In 2024, global production volumes surpassed 40.6 thousand metric tons, with the average global market price exceeding US\$ 1,900 per ton, reflecting both the rising adoption of chemical recycling technologies and the increasing demand for high-quality polyester intermediates that meet circular economy goals. Upstream, producers such as Eastman Chemical in the U.S. and Jiarun New Materials in China are developing and operating methanolysis-based depolymerization plants to scale the production of r-DMT. Eastman has invested heavily in molecular recycling infrastructure to supply recycled monomers for its specialty polymers, while Chinese companies are expanding capacity to serve both domestic and export markets. Downstream, the main buyers are polyester manufacturers producing PET resin, PBT engineering plastics, CHDM-based copolyesters, and other high-value specialty polymers. Key procurement requirements emphasize polymer-grade r-DMT with high purity and stability, as even trace impurities can affect polymerization reactivity, clarity, and mechanical performance. Customers in packaging (bottles and films), automotive (engineering resins), and electronics (copolyester-based housings and films) often secure long-term supply contracts to

ensure consistent quality and certification compliance. For PET packaging, the focus is on transparency and food-grade approval, while in engineering plastics and CHDM derivatives, thermal stability and mechanical robustness are prioritized. The chemically recycled polyester market is entering a stage of accelerated growth, with r-DMT positioned as a critical monomer to complement r-BHET in methanolysis-driven recycling systems. From 2024 to 2030, global demand is expected to rise significantly, supported by regulations targeting lower carbon emissions, corporate sustainability commitments, and consumer-driven preferences for recycled-content packaging. r-DMT securing a notable share as a feedstock for both mainstream PET and high-performance specialty copolyesters. Companies such as Eastman are leading by integrating r-DMT supply into their specialty polyester businesses, ensuring secure captive consumption while selectively marketing surplus volumes to external converters. Meanwhile, Jiarun New Materials and other Chinese producers are focusing on competitive scale-up, lower production costs, and export opportunities to meet rising demand in Europe and North America. A key trend is the strategic diversification of r-DMT beyond PET packaging into PBT resins and CHDM-based copolyesters, where recycled alternatives to virgin feedstocks provide both environmental advantages and compliance with circular economy targets. Overall, r-DMT is evolving from a niche recycled monomer into a strategically significant material that underpins both mainstream packaging markets and high-value engineering polymer segments.

The global r-DMT market size was estimated at USD 78.16 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 23.10% during the forecast period.
