Abstracts

Rabies monoclonal antibodies are highly specific therapeutic biologics engineered to target and neutralize the rabies virus by binding to its glycoprotein, thereby preventing viral entry into host cells and complementing the action of rabies vaccines in post-exposure prophylaxis. These antibodies are produced through recombinant DNA technology, ensuring consistency, purity, and scalability compared to traditional polyclonal preparations derived from human or equine blood plasma. Their mechanism involves passive immunization, providing immediate, targeted immunity while the active immune response to the vaccine develops, making them a critical component in modern rabies post-exposure protocols, particularly in resource-limited settings where access to rabies immunoglobulin may be constrained.

The global Rabies Monoclonal Antibody market size was estimated at USD 105.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
